

Redirect from root to WWW - cloudflared

https://drive.google.com/file/d/1igk01QjlggVZXxe2pbHMNy_MtNCZoxkC/view?usp=drive_link

The screenshot shows the Cloudflare dashboard interface for configuring a redirect rule. The domain is `testcastillo.com`, which is active and on the free plan. The rule name is `Redirect from Root to WWW [Template]`. Under the "If incoming requests match..." section, the "Wildcard pattern" option is selected. The "Request URL" field contains `https://testcastillo.com/*`. In the "Then..." section, the "Target URL" is `https://www.testcastillo.com/${1}` and the "Status code" is set to `301`. There is also an unchecked "Preserve query string" option at the bottom.

CLOUDFLARE

testcastillo.com Active Star Free plan

Rule name (required)
Redirect from Root to WWW [Template]
Give your rule a descriptive name.

If incoming requests match...

- Wildcard pattern**
Only apply the rule to requests matching the wildcard pattern
- Custom filter expression**
Only apply the rule to requests matching the custom filter expression
- All incoming requests**
Apply the rule to all requests

Request URL
https://testcastillo.com/*
By using the asterisk (*) character to create a pattern that can match many requests e.g. https://*.example.com/files/*
[Wildcard pattern documentation](#)

Then...
Redirect to target URL. This can be static or dynamic using a wildcard replacement \${1}, \${2}, etc.

Target URL
https://www.testcastillo.com/\${1}
e.g. https://example.com/\${1}/\${2}
[Wildcard replacement documentation](#)

Status code
301

Preserve query string
