

Configure Plex with the Porn DB Media Scanner Agent

1. Download unzip and rename the plug in
 1. <https://github.com/ThePornDatabase/ThePornDB.bundle/archive/refs/heads/main.zip>
 2. download the bundle.
 3. If the bundle is a zip file, unzip it
2. edit the file name to remove any extra text after .bundle
 1. The file extension should be .bundle
3. Copy the plug-in bundle in the Plug-ins folder at

`%LOCALAPPDATA%\Plex Media Server\Plug-ins`
4. Restart the Plex Media Server
5. Log into [The Porn DB API](#) interface and get an API token
6. Edit the Plex library with the adult video files
 1. Under the advanced tab select "ThePornDB Scenes" or "ThePornDB Movies" agent
 2. Fill in the Personal API Key field with the token obtained in step 5
 3. Make sure all check boxes are cleared, except for use a Custom Title Format
 1. Change the Title Format to whatever you want using the correct params
 4. Under the Regex to remove from filepath use " \[.*?\] "

1.

5. Save changes and exit

7. Rename the video files using the proper format

1. For a successful match to your Scenes, filenames should be in the format Site YYYY-MM-DD Title (The date is the most important part) For matching movies, try to limit filename as much as possible to the actual name of the movie. Remove any 'release tags' as much as possible

2. Using [Whisparr](#) to change the file names would be the easiest

8. Remove video files from the library, and wait a few minutes

9. Add the video files back to the library. This should cause all of the files to match properly assuming the name is correct.
