

Add a domain to the Active Directory

<https://lazyadmin.nl/it/add-a-domain-to-the-active-directory/>

How to add a domain to the Active Directory

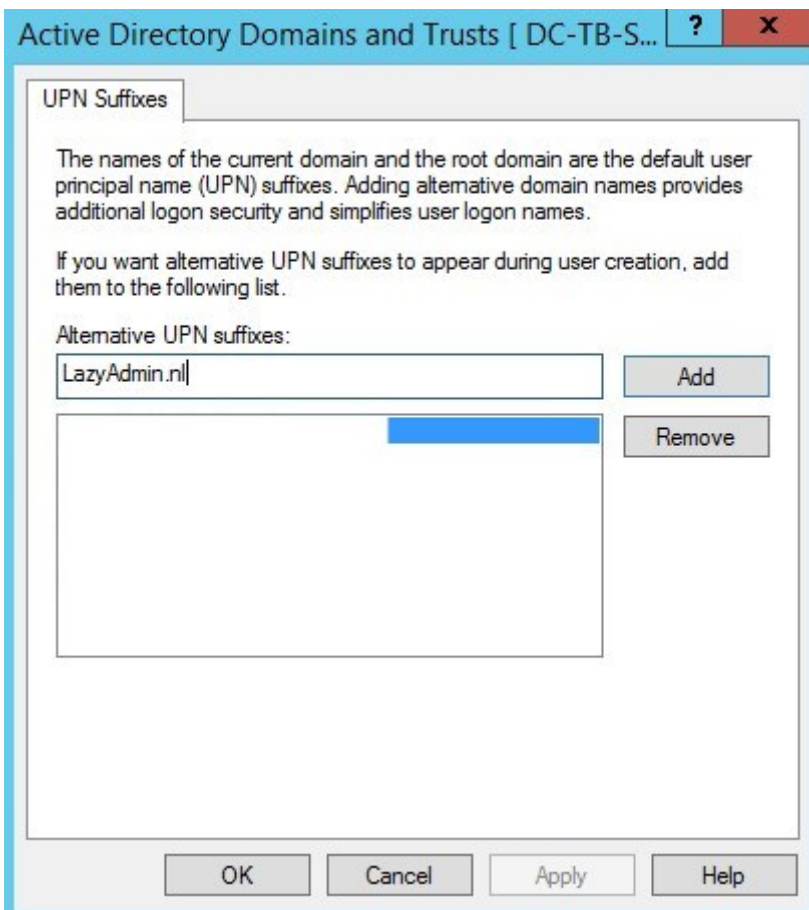

1. **Login to your domain controller**
2. **Open the “Active Directory Domains and Trusts”**
3. **Open the Properties of Active Directory Domains and Trusts**
Right-click on the top item in the left tree view and select properties

Opens the properties dialog box for the current selection.

4. Add the new Domain Name

In the UPN Suffixes dialog, enter the new domain name in the “**Alternative UPN Suffixes**” field and click on **Add**

5. **Apply the settings**

Click Apply and close the windows. The domain is now added to the domain controller.

6. **(optional) for replication to other domain controllers**

If you have multiple domain controllers you can force the replication with the following command in PowerShell / CMD: `repadmin /syncall /AdeP`

You should now be able to use the new domain name in the Active Directory or in the Exchange Administration Center.
