

DFS Checker

Overview:

DFS Checker is an Accent written software. The installation is hosted on FileVista (DFSCheckerClient_1_1_5). The software is installed on a server. The server then checks into the main DFS Checker server (ACS-00-VSRV16) hourly. VSRV16 has timetables and pathways configured on it. The client SRV will scan those pathways for files and give a total of files and size to VSRV16. VSRV16 then puts together a report to compare the total number of files between two DFS replicant servers. The purpose is to show that if DFS replication has stopped, then as new files are added, there will be a difference between the two that will become apparent on the report.

Note: if each SRV had 100 files that the other does not, the total would then be zero.

These email are set to be delivered nightly. If they are not received:

Restart service - ACS-00-VSRV17 - DFS Checker Service

If you do not receive email

Restart service - ACS-00-VSRV13 - SQL Server

Restart service - ACS-00-VSRV17 - DFS Checker Service

If you do not receive email

Reboot - ACS-00-VSRV13 - SQL Server

Restart service - ACS-00-VSRV17 - DFS Checker Service

If you do not receive email

Reboot - ACS-00-VSRV17 - SQL Server

If you do not receive email - ask Barron for help

ACS-00-VSRV16 - Labtech ID 683
