

DFSR Won't re-enable

There are times when DFS was used prior and it just won't work anymore. This has been seen in AD replication.

The DB that DFS refers to is in

C:\System Volume Information\DFSR

Within that folder is the DFS information. If that information is bad you have to purge it.

Remove the server from all DFSR

Update settings to allow you to see hidden system files

Take ownership of "System Volume Information"

Grant full access to folder and subfolders to yourself

CMD Elevated: `rmdir "C:\System Volume Information\DFSR" /s`

At this point all the DFSR information is gone but you messed with vital security permissions

I am using: `DISM.exe /Online /Cleanup-image /Restorehealth`

To hopefully get it back in-line
